Verifying email…

This step confirms your email. It does not change your password.

Web identity · Verification & recovery

P04.12 client landing design · Static visual proposal, not implemented browser behavior. Existing email templates and backend routes are unchanged.

01 · Password recovery

NxeYN Request → b6onCS Generic email acknowledgement → SI3Rc New password → WLB0k Submitting → Z8ycn Password changed → ordinary sign-in. Invalid link: mPta7 → request a fresh email. Do not auto-login or modify verification status.

02 · Email verification

Email link → xEUDW Sign in if needed → Wv8Kl Explicit confirmation → Z4EFI Submitting → NXrCl Verified → return to Cuenora. An existing matching browser session skips sign-in. Authenticated fresh-email request: g216NT → yomHn. Invalid link: e2tVCy → sign in, then request a fresh email. Uncertain confirmation: PDr3u → read authenticated account status.

03 · Account mismatch and privacy

j05SVg explains the matching-account requirement without revealing the token owner's identity. Show this state only when a mismatch is safely known. A generic token rejection must use the invalid-link screen instead; do not infer account existence or expose a different mailbox. All displayed signed-in email values come from the current authenticated identity.

04 · Form states

cXoJV shows confirmation mismatch. Other inline errors: invalid email, password outside the 15–128-character policy, common password, and generic sign-in rejection. Preserve editable input on local validation errors. Show/Hide toggles are keyboard-operable buttons with a 48-unit target; allow password-manager paste and autofill. Do not impose composition rules.

05 · Busy, throttled and unavailable

WLB0k and Z4EFI disable duplicate activation during submission. Announce progress without animated motion being required. For rate limits: 'Too many attempts. Please wait before trying again.' Use a server-provided retry time only when available. IliEr applies only when submission is known not to have happened, never to a potentially committed request.

06 · Unknown outcomes

z6IaTg is the recovery response-loss state: do not announce failure or automatically replay the reset. Offer ordinary sign-in with the new password or a fresh recovery request. For verification response loss: show 'We could not confirm the result', re-check authenticated verification status, and show success only after confirmation; do not consume the token again blindly.

07 · Browser security boundary

GET only loads the page; consumption requires explicit POST. Proposed links carry purpose-bound tokens in a fragment, removed before interaction and held only in memory. No analytics, external fonts/scripts/resources, storage, logs or credential-bearing redirects. Self-host the two brand fonts. Enforce HTTPS, no-store, no-referrer, restrictive CSP and frame restrictions during implementation.

08 · Responsive and accessible behavior

Desktop reference: RgNQ8 recovery and hf5Om verification, 1440 wide. Mobile references: 390 wide, rendered as full-page scroll specimens, not fixed viewport heights. Use one column on narrow screens; hide the editorial panel. Keep logical heading order, persistent labels, associated field errors, visible keyboard focus and status announcements. Test at 320 wide, zoom, large text and with a screen reader; static frames are not accessibility certification.

09 · Pending implementation decisions

The browser session/authentication bridge is not implemented or approved by this canvas. Do not transfer app bearer credentials in URLs. Authentication storage and any cookie/CSRF design require a separate security decision. 'Return to Cuenora' uses a fixed approved destination, never an arbitrary return URL; no native deep-link availability is assumed.

Review checklist

Checked: existing brand/token reuse; desktop/mobile primary forms; explicit verify action; recovery confirmation; generic request acknowledgement; expired/invalid links; busy states; account-bound verification; response-loss guidance. Remaining: implement and test browser behavior, focus/error announcements, 320px reflow, session bridge and real API integration.
